Open Access explained!

<https://www.youtube.com/watch?v=L5rVH1KGBCY>

What?

How?

Why?

# What?

## How?

## Why?

# What is Open Access?

- Open Access (OA) refers to the removal of major obstacles to accessing, sharing and re-using the outputs of scholarly research.
- The research process is then facilitated by ensuring rapid and widespread access to research findings such that all communities have the opportunity to build upon them.
- Read full definition @Budapest OA Initiative:  
<http://www.budapestopenaccessinitiative.org/read>

# There are currently over 700 OA policies and mandates recorded worldwide

Highcharts.com

<http://roarmap.eprints.org>

CC BY-SA 4.0

What?

How?

Why?

# There are basically two routes to OA

- The **Gold** route: **freely accessible** research articles at the point of publication (sometimes accompanied by APCs).
- The **Green** route: author self-archiving; a version of the peer-reviewed article is posted online to a repository or website.

What?

How?

Why?

# There are several reasons to go for OA!

# An overview of the main public fMRI datasets

# NKI-Rockland

## Current Sample Characteristics (As of July 2015)

The NKI-RS is designed to be a representative, heterogeneous community sample. Exclusion criteria are minimal, and subjects vary widely in many respects. The following figures provide basic demographic information for the NKI-RS as of the 689th subject. Of these 689 participants, 657 have imaging data available.

### Age

Diagnosis (Past and Current)	Total
No Diagnosis or Condition on Axis I	541
Alcohol Abuse	89
Conduct Abuse	29
Major Depressive Disorder Single Episode In Full Remission	47
Alcohol Dependence	23
Conduct Dependence	16
Phobic Disorder Without Agoraphobia	16
Major Depressive Disorder Recurrent In Full Remission	17
Attention-Deficit/Hyperactivity Disorder NOS	16
Specific Phobia	16
Depressive Disorder NOS	15
Generalized Anxiety Disorder	15
Conduct Abuse	13
Attention-Deficit/Hyperactivity Disorder Predominantly Inattentive Type	13
Attention-Deficit/Hyperactivity Disorder Combined Type	13
Social Phobia	13
Posttraumatic Stress Disorder	13
Conduct Dependence	9
Unsubstance (Not Due to a General Medical Condition)	9
Obsessive-Compulsive Disorder	9
Cyclothymic Disorder	8
Amphetamine Abuse	8
Seclusive Phobic or Anorectic Abuse	5
Major Depressive Disorder Recurrent In Partial Remission	5
Eating Disorder NOS	5
Oppositional Defiant Disorder	5
Separation Anxiety Disorder	4
Personality	4
Major Depressive Disorder Single Episode In Partial Remission	4
Phobic Disorder With Agoraphobia	3
Major Depressive Disorder Recurrent Moderate	3
Psychotic Disorder NOS	2
Chronic Motor or Vocal Tic Disorder	2
Optical Dependence	2
Attention-Deficit/Hyperactivity Disorder Predominantly Hyperactive-Impulsive Type	2
Marijuana Abuse	2
Major Depressive Disorder Recurrent Unspecified	2
Depolar II Disorder	1
Schizophrenia Paranoid Type	1
Major Depressive Disorder Single Episode Unspecified	1
Major Depressive Disorder Recurrent Mild	1
Major Depressive Disorder Single Episode Moderate	1
Mixed Disorder Due to General Medical Condition	1
Mixed Disorder Due to Substance	1
Major Depressive Disorder Recurrent Severe Without Psychotic Features	1
Seclusive Phobic or Anorectic Dependence	1
Marijuana Dependence	1
Optical Abuse	1
Tic Disorder NOS	1
Anxiety Disorder Due to General Medical Condition	1
Infantile Abuse	1
Transient Tic Disorder	1
Sublim Nervosa	1
Conduct Disorder Without Conspicuous and Overlaid Incontinence	1
Styly Dysmorphic Disorder	1
Depolar Disorder NOS	1
Anxiety Disorder NOS	1

# Human Connectome Project

HUMAN  
Connectome  
PROJECT

Mapping structural and functional connections in the human brain

## Project Goals I

- Study a large population:
  - 1,200 healthy adults
  - 300 twin pairs and their non-twin siblings
- Cutting-edge neuroimaging methods
  - 3T Skyra MRI, customized gradient (UMinn -> Wash U)
  - 7T MRI (UMinn, 200 subjects); perhaps also 10.5T
  - dMRI/tractography; R-fMRI; Task-fMRI
  - MEG/EEG (100 subjects)
- Extensive behavioral testing
- Blood samples for genotyping

# ElectroEncephalography (EEG) data

 IEEG.org

Network Data

Welcome!

<http://ieeg.org>

*Sharing, collaborating,  
and analyzing data on the cloud*

IEEG.ORG is a collaborative initiative funded by the National Institutes of Neurological Disorders and Stroke. This initiative seeks to advance research towards the understanding of epilepsy by providing a platform for sharing data, tools and expertise between researchers. The portal includes a large database of scientific data and tools to analyze these datasets.

[Overview](#) | [Downloads](#) | [Publications](#)

**Downloads:** To request access to the TUH EEG Corpus, please fill out [this form](#). You will receive an automatically-generated username and password via email.

- [TUH EEG Epilepsy Corpus \(v0.0.0\)](#): This is a subset of the TUH EEG Corpus that contains 100 subjects with and without epilepsy. We plan to expand this to 1,000 patients of each type. To request access to this data, please fill out the [attached form](#).
- TUH EEG Corpus (v1.0.0): This will be the final official release of all data collected from 2002-2014. Contact us for further details.
- [TUH EEG Corpus \(v0.6.0\)](#): A beta release used to collect feedback from the community.
- [TUH EEG Corpus \(v0.2\)](#): This is our first public release of the TUH EEG Corpus. This is a beta release intended to allow users to give us feedback on the data. There are 247 sessions, 615 EDF files, and over 150 hours of EEG data. The uncompressed data occupies about 8.3G of disk space.

The TUH EEG Corpus is freely available. The only reason we require registration is that we need to track who downloads the data. We also want to be able to inform you of any updates to the releases.

Once you have obtained the username and password, you can selectively download portions of the corpus using your browser. Due to the size of the data, the best way to transmit this data is via a hard disk. [Email us](#) for details.

**PhysioNet**  
the research resource for  
complex physiologic signals

PhysioNet offers free web access to large collections of recorded physiologic signals ([PhysioBank](#)) and related open-source software ([PhysioToolkit](#)). PhysioBank databases are made available under the [ODC Public Domain Dedication and License v1.0](#).

[PhysioNetWorks](#) workspaces are available to members of the PhysioNet community for works in progress that will be made publicly available in PhysioBank and PhysioToolkit

# NeuroImage Special Issue, January 2016

# Data Sharing Saves Money

## Results cont.

63 number of papers and courses using OpenfMRI data

60% of papers used more than one dataset

39 number of reuses of the most popular dataset [7]

\$878,400

how much it would cost to perform those studies without shared data

# Data Sharing Concerns

- Fear of being scooped
- Fear that someone finds a mistake in your analysis
- Misconceptions about data ownership

The NEW ENGLAND  
JOURNAL of MEDICINE

EDITORIAL

## Data Sharing

Dan L. Longo, M.D., and Jeffrey M. Drazen, M.D.

N Engl J Med 2016; 374:276-277 | January 21, 2016 | DOI: 10.1056/NEJMe1516564

Metrics

The aerial view of the concept of data sharing is beautiful. What could be better than having high-quality information carefully reexamined for the possibility that new nuggets of useful data are lying there, previously unseen? The potential for leveraging existing results for even more benefit pays appropriate increased tribute to the patients who put themselves at risk to generate the data. The moral imperative to honor their collective sacrifice is the trump card that takes this trick.

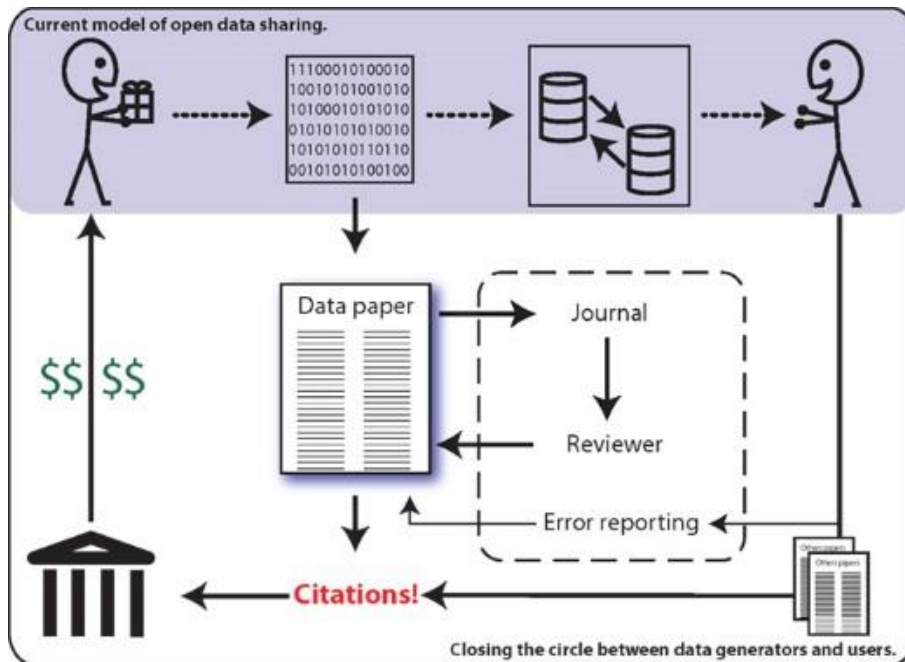

However, many of us who have actually conducted clinical research, managed clinical studies and data collection and analysis, and curated data sets have concerns about the details. The first concern is that someone not involved in the generation and collection of the data may not understand the choices made in defining the parameters. Special problems arise if data are to be combined from independent studies and considered comparable. How heterogeneous were the study populations? Were the eligibility criteria the same? Can it be assumed that the differences in study populations, data collection and analysis, and treatments, both protocol-specified and unspecified, can be ignored?

### COBIDAS

The report from the OHBM Committee on Best Practices in Data Analysis and Sharing (COBIDAS), [Best Practices in Data Analysis and Sharing in Neuroimaging using MRI](#) is ready. We received over 100 comments from the community, in the form of emails, blog posts and annotated Word/PDF files. The committee has carefully reviewed every comment and incorporated changes into the manuscript (see below). As a result, this unique best practice document really reflects views from across our field.

# BrainBox, OpenScience Prize Finalist

The  
**Open  
Science  
Prize**

Collaboratively visualize and segment  
any brain image available online

BrainBox allows you to work on  
any MRI data available online

[http://files.figshare.com/2284784/MRI\\_n4.nii.gz](http://files.figshare.com/2284784/MRI_n4.nii.gz)

you just need a web browser

BrainBox lets you work together with friends  
and see the work of each other in real time

In this way, we can build an Open  
Neuroimaging Laboratory the size of  
the planet!

# Conclusions: why share data

- It's an ethical thing to do
- The journal (PLOS) or the funder (NIH and soon EU) requires it
- Increases exposure and impact of your research (and so your chances of getting the next grant)
- It's related to higher citation rate (Piwowar et al. 2007, 2013)
- Shows that you care

Thank you!
