Academic publishing

Of goats and headaches

One of the best media businesses is also one of the most resented

May 26th 2011 | from the print edition

Like <765 Tweet <467

HOW much would you pay for an annual subscription to *Small Ruminant Research*, *Queueing Systems* or *Headache*? University librarians pay rather a lot. In Britain, 65% of the money spent on content in academic libraries goes on journals, up from a little more than half ten years ago. With budgets tight, librarians are trying to resist price increases. But Derk Haank, the chief executive of Springer, a big publisher, is firm: "We have to make a living as well."

And what a living it is. Academic journals generally get their articles for nothing and may pay little to editors and peer reviewers. They sell to the very universities that provide that cheap labour. As other media falter, academic publishers have soared. Elsevier, the biggest publisher of journals with almost 2,000 titles, cruised through the recession. Last year it made £724m (\$1.1 billion) on revenues of £2 billion—an operating-profit margin of 36%.

Academic publishers have jumped deftly from paper to the internet. For more than a decade the dominant model has been the "big deal". Publishers sell access to large bundles of electronic journals for a price based on what colleges used to pay for paper

101 INNOVATIONS IN SCHOLARLY COMMUNICATION

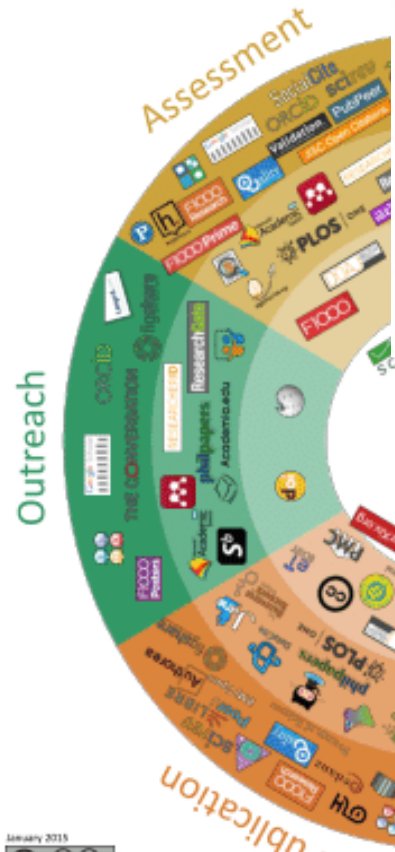

Jeroen Bosman @jeroenbosman
Utrecht University Library

Most important developments in 6 research workflow phases

Science is in transition. This post phase of a project aiming to characterize communication flows from evolution

101 Innovative tools and services (< 2015)

	Discovery	Analysis	Writing	Publication	Outreach	Assessment
Trends	social discovery tools	datadriven & crowdsourced science	collaborative online writing	Open Access & data publication	scholarly social media	article level (alt)metrics
Expectations	growing importance of data discovery	more online analysis tools	more integration with publication & assessment tools	more use of "publish first, judge later"	use of altmetrics for monitoring outreach	more open and post-publication peer review
Uncertainties	support for full-text search and text mining	willingness to share in analysis phase	acceptance of collaborative online writing	effect of journal/publisher status	requirements of funders & institutions	who pays for costly qualitative assessment?
Opportunities	discovery based on aggregated OA full text	open labnotes	semantic tagging while writing/citing	reader-side paper formatting	using repositories for institutional visibility	using author-, publication- and affiliation-IDs
Challenges				globalization of research	making outreach a two-way discussion	quality of measuring tools

Most important developments	Outreach	Assessment
Potential disruptive developments	more & better connected researcher profiles	importance of societal relevance + non-publication contributions
	public access to research findings, also for agenda setting	moving away from simple quantitative indicators

INNOVATIONS IN SCHOLARLY COMMUNICATION

Changing Research Workflows

<https://101innovations.wordpress.com/>
Survey of scholarly communication tool usage

La scienza è...

Collaboration,
NOT competition

Evaluation on the QUALITY of works, not the
prestige [IF] of journals

Quality,
NOT excellence

Fluid approach to contributions
[as free software coding]

SHARING IDEAS AND DATA

Zen scholarly communication?

Scholarly communication is distributed process of knowledge creation that requires a great conversation.

Much of scientific work is made up of collaboration rather than competition. Science exhibits the nature of networks, not that of Olympic games. Concern of quality has been replaced by an obsession for competition

Imagine writing the history of print from the perspective of the scriptoria...

1) **What will it be like?** The question can be framed in two ways:

The first is the scriptorium way: how to adapt the present to the (yet unknown) future.

Open Access debate has followed this path.

The second way, more fundamentally, strongly foregrounds the notion of “scientific communication”: **WHAT DOES IT NEED TO WORK BEST?**

- a set of useful, credible, peers;
- “crystals” of knowledge

2) **Who will control it?**

SKILLS AND SERVICES NEEDED FOR THE GREAT CONVERSATION
SHOULD SERVE ITS OBJECTIVES, NOT THE REVERSE.

Funzionale???

Openness

Every day I meet people from our vast community of thinkers and innovators. People who are tireless in their willingness to guide Europe towards ever-greater peace and prosperity. Their defining quality is openness.

Openness

Common to all these people – common to success in the research and innovation community – is openness.

It is my opinion that the future of innovation lies in bringing as many different people, concepts and fields together. The future of research in Europe lies in people like you setting its course as a community, and with those who are different from you.

In my eyes, the future lies in open innovation, because openness fuels innovation.

C. Moedas, The importance of research for the future of Europe, August 31, 2015

Open science: il futuro dell'Europa

Today's conference "Opening up to an ERA of Innovation" features a session devoted to open science.

What is open science about?

Open Science describes the on-going transitions in the way research is performed, researchers collaborate, knowledge is shared, and science is organised. It represents a systemic change in the modus operandi of science and research. It affects the whole research cycle and its stakeholders, enhances science by facilitating more transparency, openness, networking, collaboration, and refocusses science from a 'publish or perish' perspective to a knowledge-sharing perspective.

Open science is also about making sure that science serves innovation and growth. It guarantees open access to publicly-funded research results and the possibility of knowledge sharing by providing infrastructures. Facilitating access to those data will encourage re-use of research output. For example, companies, and particularly SMEs, can access and re-use data, infrastructures and tools easily and at a reasonable cost and can accelerate the implementation of ideas for innovative products and services.

Moedas – Oettinger, Opening up to an ERA of innovation, 22 giugno 2015

Open science: il futuro dell' Europa

We have to ensure that open science develops in the right way to contribute to the common effort to make the EU more competitive and maintain excellence in science.

First, it is crucial to advance open science at national, European and global levels. This requires mutual responsiveness of all key-stakeholders involved - research performing organisations, research funding organisations, and businesses, and will imply a review of how science is evaluated, the creation of new research funding mechanisms, and alternative ways of publishing.

Second, we need to create an open science environment that is friendly to both science and business.

Third, open science should be an inclusive process. We need to stimulate further engagement of open science stakeholders ranging from individual researchers to universities, from start-ups to large companies. Open science is also about making sure that science becomes more responsive to socio-economic and citizens' demands. It will enable faster innovation

Moedas – Oetinger, Opening up to an ERA of innovation, 22 giugno 2015

[Fifth freedom]

Janez Potočnik

2007

European Commissioner for Science and Research

The EU's Fifth Freedom: creating free movement of knowledge

http://ec.europa.eu/research/era/index_en.htm

- **More effective national research systems** – including increased competition within national borders and sustained or greater investment in research
- **Optimal transnational co-operation and competition** - defining and implementing common research agendas on grand-challenges, raising quality through Europe-wide open competition, and constructing and running effectively key research infrastructures on a pan-European basis
- **An open labour market for researchers** - to ensure the removal of barriers to researcher mobility, training and attractive careers
- **Gender equality and gender mainstreaming in research** – to end the waste of talent which we cannot afford and to diversify views and approaches in research and foster excellence
- **Optimal circulation, access to and transfer of scientific knowledge including via digital ERA** - to guarantee access to and uptake of knowledge by all.

EUROPEAN RESEARCH AREA

Open market
for researchers

Gender
equality

Accessing
knowledge

Optimal circulation, access to and transfer of scientific knowledge

To guarantee access to and uptake of knowledge by all.

Research and innovation benefit from scientists, research institutions, businesses and citizens accessing, sharing and using existing scientific knowledge and the possibility to express timely expectations or concerns on such activities. A major challenge is to broadly implement Open Access - i.e. free internet access to and use of publicly-funded scientific publications and data - given the uneven state of advancement of Member State policies in this area. More generally, to increase the economic impact of research, we need to foster Open Innovation, links between research, business and education (the knowledge triangle) as via EIT and in particular knowledge transfer between public research institutions and the private sector while respecting intellectual property rights. As most knowledge creation and transfer uses digital means, all barriers preventing seamless online access to digital research services for collaboration, computing and accessing scientific information (e-Science) and to infrastructures must also be removed by promoting a digital ERA. The different types of knowledge transfer, circulation and access should also be judiciously factored into research cooperation with non-EU countries.

An open labour market for researchers

Facilitating mobility, supporting training and ensuring attractive careers

While researcher mobility contributes to excellence, several obstacles stand in the way of a genuine European research labour market. One of the most important is the lack of transparent, open and merit-based recruitment, which makes research careers less attractive and hampers mobility, Gender equality and research performance.

Giving non-nationals/ non-residents access to national grants and making them portable across borders would make mobility easier. In some cases, legal and administrative barriers prevent this. Initiatives such as 'Money Follows Researcher' show how those barriers can be removed and how Member States and research organisations can organise access to and portability of national grants, while upholding the interests of all parties.

23/06/2015

I am convinced that **excellent science is the foundation of future prosperity,**
and that **openness is the key to excellence.** [...]
We need more open access to research results and
the underlying data. Open
access publication is already a requirement
under Horizon 2020, but we now need to look
seriously at open data[...]

**Let's dare to make Europe open to
innovation, open to science and open
to the world.**

by John Timmer - Apr 23 2012, 9:52pm E

SCIENCE SCIENCE POLICY AND EDUCATION

The problems with state funding may be hitting public schools hard, but even some parts of elite private institutions are feeling the sting of rising prices. That was the message sent by the Harvard Library's Faculty Advisory Council, which says the costs of subscriptions to major research journals "cannot be sustained." It says that the cost of these journals has gone up by 145 percent over the last six years and, if things continue at that pace, it'll be forced to cut back.

HORIZON 2020

The EU Framework Programme for Research and Innovation

European Commission > Horizon 2020

Article 43

Exploitation and dissemination of results

With regard to the dissemination of results through scientific publications, open access shall apply under the terms and conditions laid down in the grant agreement. Costs relating to open access to scientific publications that result from research funded under Horizon 2020, incurred within the duration of an action, shall be eligible for reimbursement under the conditions of the grant agreement. With due regard to Article 18 of Regulation (EU) No 1291/2013, the grant agreement shall not stipulate conditions regarding open access to publications which would result in additional publishing costs after the completion of an action.

With regard to the dissemination of research data, the grant agreement may, in the context of the open access to and the preservation of research data, lay down terms and conditions under which open access to such results shall be provided, in particular in ERC frontier research and FET (Future and Emerging Technologies) research or in other appropriate areas, and taking into consideration the legitimate interests of the participants and any constraints pertaining to data protection rules, security rules or intellectual property rights. In such cases, the work programme or work plan shall specify the conditions for the dissemination of research data through

Arsenate toxicity on the apices of *Pisum sativum* L. seedling roots: Effects on mitotic activity, chromatin integrity and microtubules

Stefania Dho, Wanda Camusso, Marco Mucciarelli, Anna Fusconi

Abstract

Arsenic (As) is one of the most toxic pollutants in the environment, where it severely affects both animal and plant growth. Despite the growing literature data on As effects on plant development, alterations induced by this element on meristem activity of the apical cells were also analyzed. In the present study, short-term experiments with arsenate have been conducted on *Pisum sativum* L. seedlings to assess whether plant growth impairment is due to DNA/chromosome or mitotic microtubule damages. Root growth was studied by evaluating apical meristem activity and cell elongation. Mitotic aberrations, DNA fragmentation and microtubule organization of the apical cells were also analyzed. The results have shown that arsenate, at the lowest concentration (0.25 μM), slightly increases root growth and some related parameters, whilst the other concentrations have a dose-dependent negative effect on root growth, on the mitotic and labelling index (after bromo-deoxyuridine administration), and on the mitotic arrays of microtubule (through immunofluorescence). The main effects on mitosis occurred for 25 μM As. The percentage of metaphases increased, as did the irregular metaphases and c-mitoses. This was related to alterations in the mitotic spindles, which closely resemble those induced by colchicine. Chromosome breaks and anaphase bridges were virtually absent, whilst DNA fragmentation only increased from 25 μM arsenate onwards. These data point to a poor clastogenic activity of As and implicate that microtubules are one of the main targets of As.

Keywords

Pea; Arsenic; Apical meristems; Aberrations; Immunofluorescence; TUNEL test

1. Introduction

Arsenic (As) is a toxic element, frequently found in soils and water. A main natural source of As is the erosion of mother rock, even though a consistent part of As environmental pollution comes from human activities (Meharg and Hartley-Whitaker, 2002 and Patra et al., 2004). The As in unpolluted fresh water is usually in the range 1–10 $\mu\text{g/L}$. According to EPA and WHO, the maximum permissible As concentration in drinking water is 50 $\mu\text{g/L}$ (Mandal and Suzuki, 2002).

Arsenic is a well-established human carcinogen (Qin et al., 2008a) and has been shown to be genotoxic in a variety of *in vitro* studies (Hughes, 2002). In plants, it severely affects growth and development, and its toxicity is strongly dependent on the concentration, exposure time and physiological state of the plant (Singh et al., 2007). However, plants vary in their sensitivity to As, and a wide range of species have been identified in As-contaminated soils (Meharg and Hartley-Whitaker, 2002). Besides, hyperaccumulators such as *Pteris vittata*, which tolerate high internal As content, may also use this As to defence themselves against herbivore attack (Mathews et al., 2009).

Higher plants take up As mainly as arsenate (V), the dominant form of phytoavailable As in aerobic soils. According to Meharg and Hartley-Whitaker (2002), As competes with phosphate for plant phosphate transporters. Upon absorption, most arsenate is rapidly reduced to arsenite (III), due to an arsenate reductase activity (Xu et al., 2007), hence, the arsenate cytoplasmic concentration is generally not high enough to exert toxicity (Meharg and Hartley-Whitaker, 2002). Both As species interfere with various metabolic pathways: arsenate, as an analogous chemical to phosphate, may replace phosphate in the ATP and in various

1. Introduction

Arsenic (As) is a toxic element, frequently found in soils and water. A main natural source of As is the erosion of mother rock, even though a consistent part of As environmental pollution comes from human activities (Meharg and Hartley-Whitaker, 2002; Patra et al., 2004). The As in unpolluted fresh water is usually in the range 1–10 $\mu\text{g/L}$. According to EPA and WHO, the maximum permissible As concentration in drinking water is 50 $\mu\text{g/L}$ (Mandal and Suzuki, 2002).

Arsenic is a well-established human carcinogen (Qin et al., 2008a) and has been shown to be genotoxic in a variety of *in vitro* studies (Hughes, 2002). In plants, it severely affects growth and development, and its toxicity is strongly dependent on the concentration, exposure time and physiological state of the plant (Singh et al., 2007). However, plants vary in their sensitivity to As, and a wide range of species have been identified in As-contaminated soils (Meharg and Hartley-Whitaker, 2002). Besides, hyperaccumulators such as *Pteris vittata*, which tolerate high internal As content,

may also use this As to defence themselves against herbivore attack (Mathews et al., 2009).

Higher plants take up As mainly as arsenate (V), the dominant form of phytoavailable As in aerobic soils. According to Meharg and Hartley-Whitaker (2002), As competes with phosphate for plant phosphate transporters. Upon absorption, most arsenate is rapidly reduced to arsenite (III), due to an arsenate reductase activity (Xu et al., 2007), hence, the arsenate cytoplasmic concentration is generally not high enough to exert toxicity (Meharg and Hartley-Whitaker, 2002). Both As species interfere with various metabolic pathways: arsenate, as an analogous chemical to phosphate, may replace phosphate in the ATP and in various phosphorylation reactions, leading to the disruption of the energy flow in cells. The toxicity of arsenite is mainly ascribed to its reaction with sulphhydryl groups of proteins that interfere with their functions (Meharg and Hartley-Whitaker, 2002; Patra et al., 2004).

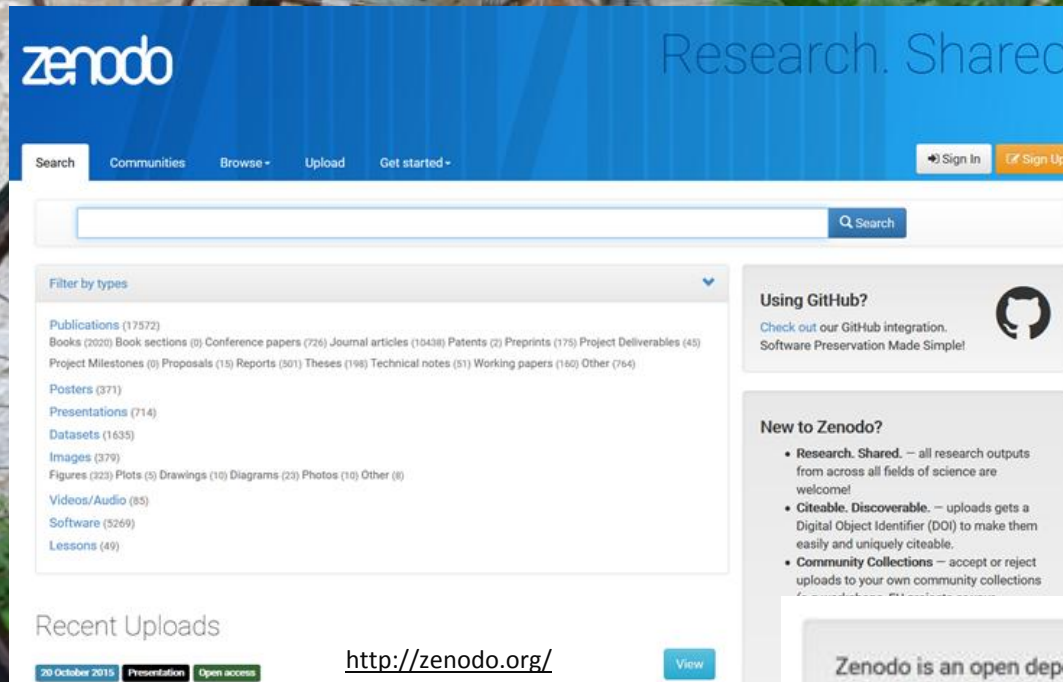

Exposure to high concentrations of As induces the production of reactive oxygen species (ROS) (Singh et al., 2007; Wang et al., 2007; Lin et al., 2008; Shri et al., 2009) and the conversion of arsenate to arsenite is regarded as one of the causes of ROS generation (Wang et al., 2007). Oxidative stress induced by As can damage cells, mainly through lipid peroxidation of membranes (Singh et al., 2007) and DNA fragmentation, as has been demonstrated in leaves and roots

New to Zenodo?

- **Research. Shared.** — all research outputs from across all fields of science are welcome!
- **Citable. Discoverable.** — uploads gets a Digital Object Identifier (DOI) to make them easily and uniquely citable.
- **Community Collections** — accept or reject uploads to your own community collections

Zenodo is an open dependable home for the long-tail of science, enabling researchers to share and preserve any research outputs in any size, any format and from any science.

Ethics and Access 1: The Sad Case of Jeffrey Beall

Open access (OA) is all about ethics, economics and equity, and the three interact in various ways. OA is inherently at the intersection of libraries, media, policy and technology—but that's a different issue.

This is the first of a trio of essays: two related to fairly specific situations, one covering a recent case and the other a more general one. The third essay is a more general one. The third essay is a more general one.

ways a little different, however. He first encountered OA when reviewing a publisher, Bentham Open, for The Charleston Advisor. It's a very negative review for what seem to be good reasons, and at the time Beall seemed to be at least potentially positive about OA itself, based on the first sentence of this extract:

The Open Access model is a good one, for it makes research freely available to everyone. However, Bentham Open is exploiting the good will of those who established the Open Access model by twisting it and exploiting it for profit. Just because a journal is Open Access doesn't make it legitimate or high quality.

ways a little different, however. He first encountered OA when reviewing a publisher, Bentham Open, for The Charleston Advisor. It's a very negative review for what seem to be good reasons, and at the time Beall seemed to be at least potentially positive about OA itself, based on the first sentence of this extract:

Choose the right journal for your research

Home Think Check Submit About FAQ

Sharing research results with the world is key to the progress of your discipline and career. But with so many publications, how can you be sure you can trust a particular journal? Follow this check list to make sure you choose trusted journals for your research.

Are you submitting your research to a trusted journal?
Is it the right journal for your work?

Does scientific misconduct cause patient harm? The case of Joachim Boldt

with 23 comments

If you wanted to minimize the real-life effects of misconduct, you might note that some of the retractions we cover are in tiny obscure journals hardly anyone reads. But a new [meta-analysis](#) and editorial in JAMA today suggests — as a [study by Grant Steen did a few years ago](#) — that the risk of patient harm due to scientific misconduct is not just theoretical.

As the [editorialists note](#), hydroxyethyl starches (HES) are “synthetic fluid products used commonly in clinical practice worldwide.”

“Synthetic colloids received market approval in the 1960s without evaluation of their efficacy and safety in large phase 3 clinical trials. Subsequent studies reported mixed evidence on their benefits and harms.”

There has been controversy over the use of HES for decades, with the [most recent high-level review](#) showing “no significant mortality increase.” But one of the reasons for that review — by the prestigious Cochrane Collaboration — was to see if the dozens of now-retracted studies by [Joachim Boldt](#) had an effect on the overall evidence for HES. Boldt's retractions resulted from a lack of evidence of IRB approval, as well as the likelihood of faked data.

An internal investigation found [no evidence of harm to the patients Boldt treated](#), and the the Cochrane review found “no change in the findings related to the inclusion or exclusion of the studies by Boldt et al.,” according to the editorial. But the new meta-analysis found something different:

“After exclusion of the studies by Boldt et al, Zarychanski et al found that hydroxyethyl starch was associated with a significantly increased risk of mortality (risk ratio [RR], 1.09; 95% CI, 1.02–1.17) and renal failure (RR, 1.27; 95% CI 1.09–1.47).

In other words, there was an increased risk of death and kidney failure among those given HES:

“The report of scientific misconduct have concluded these studies demonstrate a new system of scientific might reasonably uses in which also outlines in light of

Cosa non è l'Open Access / 1

NON è in contrasto con la peer review,
che anzi è spesso condotta in modo
più trasparente

Cosa non è l'Open Access / 2.1

NON è un canale di serie B - archivi

- negli archivi, lavori già pubblicati altrove (e referati altrove)
- che interesse ho a far vedere al mondo un lavoro mediocre, o copiato, o scientificamente non solido??????

Cosa non è l'Open Access / 2.2

NON è un canale di serie B - riviste

9

Reasons for not publishing OA?

Nature Pub. Group, 2015 Authors' insights survey

"Which of the following are reasons why you haven't published any of your articles via an immediate open access model in the past three years?" (select all that apply)

Anche per le riviste, la qualità è in crescita

The most common reason given for not publishing Open Access is a concern about perceptions of quality, but the proportion of authors with this opinion seems to be in decline.

Base: 7,955

questo è il vero problema...

Cosa non è l'Open Access / 3

NON è un veicolo di plagio, anzi,
deposito garantisce data certa.
E “attribuzione” è unico requisito

for any responsible purpose, subject to proper attribution of authorship

Cosa non è l'Open Access / 4

NON è in contrasto con il diritto d'autore

- negli archivi, solo materiale che non viola il copyright
- consigliate le Licenze Creative Commons

Copyright/diritto d'autore

Author Rights: Using the SPARC Author Addendum to secure your rights as the author of a journal article

Share: [t](#) [f](#) [G](#) [in](#) [e](#)

Article | Documents | Guide/Informational | Libraries | Authors | Students | Author Rights | Open Access

The text below is also available in [PDF format](#), and the image is available as a [poster](#). [Click here to download the Addendum now.](#)

Your article has been accepted for publication in a journal and, like your colleagues, you want it to have the widest possible distribution and impact in the scholarly community. In the past, this required print publication. Today you have other options, like online archiving, but the publication agreement you'll likely encounter will actually prevent broad distribution of your work.

You would never knowingly keep your research from a readership that could benefit from it, but signing a restrictive publication agreement limits your scholarly universe and lessens your impact as an author.

Why? According to the traditional publication agreement, all rights—including copyright—go to the journal. You probably want to include sections of your article in later works. You might want to give copies to your class or distribute it among colleagues. And you likely want to place it on your Web page or in an online repository if you had the choice. These are all ways to give your research wide exposure and fulfill your goals as a scholar, but they are inhibited by the traditional agreement. If you agree to the publisher's standard form, is there any way to retain these critical rights?

Chris H.J. Hartgerink's Notebook

<http://onsnetwork.org/chartgerink/2015/11/16/elsevier-stopped-me-doing-my-research/>

Elsevier stopped me doing my research

3000-0003-1050-0819

I am a statistician interested in detecting potentially problematic research such as data fabrication, which results in unreliable findings and can harm

To this end, I am content mining results reported in the psychology literature. Content mining the literature is a valuable avenue of investigating research results and found that 1/8 papers (of 30,000) contains at least one result that could directly influence the substantive conclusion [1].

In new research, I am trying to extract test results, figures, tables, and other information reported in papers throughout the majority of the psychology from, for instance, Scindirect. I was doing this for scholarly purposes and took into account potential server load by limiting the amount of paper and I only wanted to extract facts from these papers.

Full disclosure, I downloaded approximately 30GB of data from Scindirect in approximately 10 days. This boils down to a server load of 35KB/s.

Approximately two weeks after I started downloading psychology research papers, Elsevier notified my university that this was a violation of the acc did immediately). otherwise Elsevier would cut all access to Scindirect for my university.

I am now not able to mine a substantial part of the literature, and because of this Elsevier is directly hampering me in my research.

[1] Nuijten, M. B., Hartgerink, C. H. J., van Assen, M. A. L. M., Epskamp, S., & Wicherts, J. M. (2015). The prevalence of statistical reporting error

[MINOR EDITS: the link to the article was broken, should be fixed now. Also, I made the mistake of using "0.0021GB/s" which is now changed into directed me towards it.]

"The Right to Read is the Right to Mine..."

Share: [t](#) [f](#) [G](#) [in](#) [✉](#)

NOVEMBER 19, 2015

Author: [Heather Joseph](#)

"The Right to Read is the Right to Mine..."

Those words are not only the tagline for an innovative text and data mining project called [ContentMine](#), but are also a crucial component of the definition of Open Access.

The facts contained in scholarly articles are what make them so useful and so valuable. Researchers recognize that the digital environment gives them the opportunity to use these articles, and to make sense of these facts in entirely new ways. They want, and need, the ability to fully use these articles - to freely download and search, text mine, data mine, compute on and crawl them as data - in order to advance their work, to discover, to innovate.

Digital articles are, after all, simply small-scale aggregations of digital data. So it makes sense to empower users to employ the tools that are most appropriate to solving the problem at hand. Yet increasingly, we are seeing troubling signs that many commercial publishers are unwilling to support users who want to actually **use** the content in scholarly articles and not simply **read** the content in an analog fashion.

In an article in today's [TechDirt](#), Glyn Moody reports on a recent incident where a statistician attempted to use content mining techniques to advance his work, which involves improving detecting data fabrication - a legitimate and valuable academic pursuit.

The researcher, who works at an institution with a subscription to Elsevier's ScienceDirect database, notes that he took care to conduct the necessary bulk downloading of articles from Elsevier's database in a manner that

[Uno scontro in atto]

Why academics need to lobby for copyright reform – now

<https://juliareda.eu/2015/09/academics-for-copyright-reform/>

This speech was given at EPIP 2015 in Glasgow, UK on September 2nd, 2015

MEP Julia Reda
Greens/EFA, Pirate Party

Date: 10.09.15
Category: General
Comments: 1
Author: Julia Reda

If we consider evidence-based policy making a desirable goal, then we need to take a stand for research and education.

“CURRENTLY, COPYRIGHT IS UNDERMINING OUR ABILITY TO CONDUCT RESEARCH”

TWEET THIS!

My copyright report, adopted by an overwhelming majority in the European Parliament, lists goals like:

- ▶ a new exception for content mining
- ▶ the harmonisation of exceptions for research and education
- ▶ simplifying cross-border and online projects
- ▶ new exceptions for libraries and archives
- ▶ legal protection of the public domain
- ▶ protection of exceptions and limitations from contractual override
- ▶ fully harmonising copyright terms at the lowest levels that currently exist in the EU
- ▶ a comprehensive set of users' rights

These reforms are within reach. But the proposals are heavily attacked by scientific publishers. In a situation where scientific publishers are among the most profitable businesses in the world, and universities are not just spending significant proportions of their budgets on licences, but also on navigating and negotiating terms of an overly complex copyright system, resources are unnecessarily diverted from creating sound evidence.

Open rights / 4

The Licenses

**Attribution
CC BY**

This license lets others distribute, remix, tweak, and build upon your work, even commercially, as long as they credit you for the original creation. This is the most accommodating of licenses offered. Recommended for maximum dissemination and use of licensed materials.

[View License Deed](#) | [View Legal Code](#)

**Attribution-NonCommercial
CC BY-NC**

This license allows for redistribution, commercial and non-commercial, as long as it is passed along unchanged and in whole, with credit to you.

[View License Deed](#) | [View Legal Code](#)

**Attribution-NonCommercial-ShareAlike
CC BY-NC-SA**

This license lets others remix, tweak, and build upon your work non-commercially, as long as they credit you and license their new creations under the identical terms.

[View License Deed](#) | [View Legal Code](#)

**Attribution-ShareAlike
CC BY-SA**

This license lets others remix, tweak, and build upon your work even for commercial purposes, as long as they credit you and license their new creations under the identical terms. This license is often compared to "copyleft" free and open source software licenses. All new works based on yours will carry the same license, so any derivatives will also allow commercial use. This is the license used by Wikipedia, and is recommended for materials that would benefit from incorporating content from Wikipedia and similarly licensed projects.

[View License Deed](#) | [View Legal Code](#)

**Attribution-NonCommercial
CC BY-NC**

This license lets others remix, tweak, and build upon your work non-commercially, and although their new works must also acknowledge you and be non-commercial, they don't have to license their derivative works on the same terms.

[View License Deed](#) | [View Legal Code](#)

**Attribution-NonCommercial-NoDerivs
CC BY-NC-ND**

This license is the most restrictive of our six main licenses, only allowing others to download your works and share them with others as long as they credit you, but they can't change them in any way or use them commercially.

Legge italiana sull'Open Access

Legge
112/2013

«2. I soggetti pubblici preposti all'erogazione o alla gestione dei finanziamenti della ricerca scientifica adottano, nella loro autonomia, le misure necessarie per la promozione dell'accesso aperto ai risultati della ricerca finanziata per una quota pari o superiore al 50 per cento con fondi pubblici, quando documentati in articoli pubblicati su periodici a carattere scientifico che abbiano almeno due uscite annue. I predetti articoli devono includere una scheda di progetto in cui siano menzionati tutti i soggetti che hanno concorso alla realizzazione degli stessi. L'accesso aperto si realizza:

a) tramite la pubblicazione da parte dell'editore, al momento della prima pubblicazione, in modo tale che l'articolo sia accessibile a titolo gratuito dal luogo e nel momento scelti individualmente;

b) tramite la ripubblicazione senza fini di lucro in archivi elettronici istituzionali o disciplinari, secondo le stesse modalità, entro diciotto mesi dalla prima pubblicazione per le pubblicazioni delle aree disciplinari scientifico-tecnico-mediche e ventiquattro mesi per le aree disciplinari umanistiche e delle scienze sociali.

STATEMENT - 12 October 2015

Commissioner Moedas and Secretary of State Dekker call on scientific publishers to adapt their business models to new realities

JOINT STATEMENT

Commissioner Moedas and Secretary of State Dekker call on scientific publishers to adapt their business models to new realities

Brussels, 12 October 2015

In Horizon 2020, the EU's research and innovation programme, all costs for open access are eligible for reimbursement during the duration of the project. However, the Commissioner warned that the Commission will adapt this policy if it finds that publishers are charging excessive article processing charges for opening access to articles.

MODIFICATION OF CONTRACT

Between	[Author's contact details], hereafter named the «Author»
	[Publisher's contact details], hereafter named the «Publisher»

The object of the present amendment is to modify and complete the contract signed on [date] between the Parties designated above regarding the publication of the work entitled :
[Citation]

The Parties consider that allowing broad access to scientific and academic research work is in the general interest. Consequently, they agree by the present amendment that the Author may deposit his/her work on the University of Turin's A_{per}TO Institutional Repository (<http://aperto.unito.it>) and make it available to the public.

To this end, the Parties agree that the publication contract shall be modified to include the following clause regarding the copyrights granted in the licence

*The Publisher expressly authorizes the Author to diffuse the work on the A_{per}TO Institutional Repository website:

☐ from the moment of its publication
☐ at the end of a [number] month embargo

as a:

☐ Publisher's Pdf (version published with the publisher's layout, formatting and trademarks)
☐ Author's Accepted Manuscript / Post-print (author's final accepted and validated version, without publisher's layout, formatting and trademarks)

To this end, the Author has the right to have his/her work reproduced in all forms, using all the techniques and platforms necessary to its archiving, distribution and use, with a view to its online diffusion and transmission via the Internet network.

The present amendment is an integral part of the publication contract as defined beforehand. It will take effect on the date it is signed by the Parties.

Drawn up in [place] on [date], ... in as many original copies as there are Parties, each of which acknowledges having received an original.
