Open science da bibliotecari

In 2022, we see a world where:

- Open Access is the predominant form of publishing;
- Research Data is Findable, Accessible, Interoperable and Reusable (FAIR);
- Digital Skills underpin a more open and transparent research life cycle;
- Research Infrastructure is participatory, tailored and scaled to the needs of the diverse disciplines;
- The cultural heritage of tomorrow is built on today's digital information.

<http://libereurope.eu/strategy/innovative-scholarly-communication/>

Priorities

- **Open Access of Research Publications:** developing innovative services on top of the repository network; advancing Open Access business models for journals and the role of libraries therein, and the possibilities for libraries as Open Access publishers and innovative publishing.
- **Research Data Management:** exploring and developing library services regarding FAIR research data, such as support for data management during research projects and support for data archive/data repositories to store and publish research datasets, and linking data to publications.
- **Innovative Metrics:** developing innovative metrics meant to monitor and evaluate research.
- **Innovative Peer Review:** participating in developments regarding innovations in peer review.

Open science

Humanities publishing can be a harsh and unforgiving place for open access.

We understand. In 2018, the [Open Library of Humanities](#) will pool its knowledge and resources to empower its membership, its authors and the wider humanities open access community. Now is the time to form the bonds that will give strength and conviction to all those supporting the APC-free gold open access of the future.

March 2018

The OLH wants humanities librarians and scholars strong and ready to fight.

Everyone has their role to play and the OLH is working hard to help you play yours with tailored support. The **EmpowOA** programme is here to provide scholars and librarians working in the humanities with tools, spaces and cogent arguments.

Our manifesto is three-fold:

Librarians are our energy. The OLH will strengthen libraries' collective power.

Each existing library member of the OLH consortium can now [refer their colleagues](#), earning both the referrer and the referee a **10 per cent discount**. The more partners you refer, the more you save. Tell a collaborator or consortium partner today! Your hard-earned funds will go further, supporting humanities research.

Librarians who visit the OLH website will soon be able to access a [toolkit](#) created with their needs in mind, equipping them to fight for the humanities, including videos, infographics, advocacy FAQs and reference sheets to strengthen the argument for an OLH membership or renewal. We are here to listen and to respond.

The scholars who edit and write for our journals are building an international open access community. The OLH will strengthen this powerful advocacy network.

Those who need OA support will soon have access to a **network of advocates**, a collective of librarians and scholars ready to educate and inform. Academics will be better equipped to argue for OA with their librarians and to offer them a referral discount. [Volunteer today!](#)

Scholars who visit the OLH website will soon have access to [resources](#) tailored to their needs, with data and infographics to equip them for their OA travails. [We want to hear your ideas.](#)

Humanities scholars and librarians are our lifeblood. The OLH will support this growing community.

We have initiated [#EmpowOA twitter chat](#) on Fridays at 7am PST/10am EST/3pm GMT/4pm CET. The conversation will also come to [Facebook](#). **Follow, share and like!** Each session, a prominent figure or panel in humanities OA will field answers to a series of stimulus questions and moderate a discussion. [Suggest a topic and enrich the debate!](#) The archive is available [on Wakelet](#).

Libraries as bridge-builders

Since creative solutions are often formed at the borders between disciplines, it is necessary to create interfaces and experimental fields for open science and open innovation in finance, science and administration. The inclusion of actors who were not previously represented in research processes leads to positive synergy effects, which emerge from the amalgamation of ideas from science and daily life. If data and results are shared, this means scientists do not have to repeat their work and there is inspiration for new research topics. The opening up of science has positive effects when it comes to motivating young talents in universities and research institutes, since they have increased autonomy and scope for creativity.

The opening up of science entails new ways of thinking when it comes to scientific study. Transparency, a willingness to share knowledge and an openness to research questions from non-specialists are encouraged. Current notions of reputation make it difficult to agree in this respect; the development of university structures could introduce new impulses for openness and innovation in research and teaching. Furthermore, the transfer from the universities into finance and society could be reinforced. This is because the opening of science generates the methodical and cultural conditions for open innovation in science, which in turn contributes to an open, value-oriented innovation system.

Bridge-building is encouraged when it comes to the promotion of open science, where there are still large gaps in knowledge between scientists on one side and the e-infrastructure landscape on the other. So far these communities have been working very far apart from one another. This is where libraries could make a very important contribution, especially when it comes to building bridges between the different communities and target groups in order to promote open innovation.

Pathways to Open Access

APPROACHES & STRATEGIES

For each approach to OA, we systematically analyze below:

- Nature of approach
- Prevalence and impact
- Strategies to achieve approach (including specific challenges and
- Systemic challenges
- Systemic opportunities

Green OA

Nature of Approach

Green open access is repository-based open access. Green OA models are access behaviors, relying instead on institutions and authors to take steps to make works freely available in online repositories that may be (and often are) managed by the author or institution. In essence, successful green open access requires: the right to share a given work, the motivation to share it, and a location for sharing it (i.e., a repository).

The transfer of a work's copyright from the author to the publisher has long been a standard practice within academic publishing. Such transfers often relinquish some or all relevant rights, including the author's permission to post or reuse work. Without reservation of license rights, the author no longer retains the necessary rights to publish openly the final version of the work.

Challenges

1. Barriers to posting

Authors face a varied set of barriers to deposit that hamper participation rates and, ultimately, the transformativeness of Green OA. Authors' reasons for not depositing their work include: opposition or indifference to OA; unfamiliarity or discomfort with OA; the lack of time for deposit, or the necessary support to do so properly; and the lack of meaningful incentives rewarding deposit or penalizing non-participation. And even where authors participate, the process and its demands can be complicated enough to lead to the posting of versions not covered by the relevant policies or licenses. So long as Green OA relies on voluntary author participation, observed author indifference, confusion, and inertia will serve to prevent full participation. Indeed, even when publication management software layers, like Symplectic Elements, are added to repository services to facilitate deposit, author uptake remains limited due to the burdens imposed by even the most streamlined and accurate claim-and-upload systems.

2. Dependence on publisher forbearance

Green OA as practiced today depends in large part on publisher forbearance from enforcing posting policies. Except where green availability is funder mandated, policies facilitating the practice are generally soft: Harvard-style institutional policies are waivable and publisher sharing policies are gratuitous, variable, and shifting—for all practical purposes, ephemeral. Even when these arrangements hold, imperfect execution leaves them open to publisher-driven takedown efforts. While recent trends have favored Green OA availability, these are dependent on the continued cooperation of publishers, which might be less forthcoming if, for instance, the model were successful in reducing publisher revenues.

3. Versioning complications

Publisher self-archiving policies, funder mandates, and institutional open access policies typically limit the version of the manuscript that can be posted to a Green OA repository. Although the exact

Report: Louisiana State University is Suing Elsevier For Breach of Contract May 2017

Filed by [Gary Price](#) on  May 2, 2017

UPDATE December 21, 2017 [LSU Libraries, Elsevier Quietly Resolve Suit Over Journal Access](#) (by [Andrew Albanese, Publishers Weekly](#))

UPDATE: May 3, 2017 We've added a comment about the lawsuit from Elsevier and a blog post by ARL's Krista Cox with additional background. They're both found at the bottom of this post.

—

The news about the lawsuit filed on Feb. 27, 2017 comes today via an announcement from the Association of Research Libraries (ARL).

The complaint was filed in the [Parish of East Baton Rouge \(19th District Circuit Court, State of Louisiana\)](#). Primary documents are linked at the bottom of this post.

Here's a portion of the news release written by ARL's Director of Public Policy, Krista Cox.

Louisiana State University (LSU) filed a lawsuit on February 27, 2017, against international science publisher Elsevier B.V. for breach of contract resulting from the publisher's exclusion of the LSU School of Veterinary Medicine from accessing content licensed by the LSU Libraries. In filing the lawsuit, LSU exercised sound financial stewardship of its public resources.

Are peer-reviewers free to openly share the content of their reviews if journal editors haven't explicitly told them not to? Jon Tennant, a scientist-turned-outreach specialist, thinks so.

Tennant had reviewed a research paper submitted to the journal *Palaeogeography*, *Palaeoclimatology*, *Palaeoecology*. He recommended that the authors' new approach to studying fossil seabird fauna should be published. The journal's editors agreed and published the paper.

IOSSG

Italian Open Science Support Group

IOSSG - Italian Open Science Support Group non è un'associazione ma un **gruppo di lavoro** transuniversitario, nato dalla collaborazione di professionisti con competenze trasversali, operanti nell'ambito delle aree: supporto alla ricerca, biblioteche digitali, Open Science, legale, ICT e provenienti da Open AIRE, Università di Milano, Università Ca' Foscari Venezia, Politecnico di Milano, Università di Torino, Università di Bologna, Università di Trento, Università di Parma, Università di Padova, Università di Vienna, Università di Trieste. L'adesione a IOSSG è assolutamente su **base volontaria** e non implica un coinvolgimento istituzionale.

IOSSG è stato indicato dalla Commissione Europea membro della "**Coalition of doers**" in EOSC.

Coordinamento: Paola Gargiulo ([OpenAIRE](#)-[NOAD](#)-Italia).

IOSSG si avvale della partecipazione del mondo aziendale che contribuisce con progetti legati a servizi e tecnologie open source ([4Science](#)) e del contatto diretto con associazioni internazionali ([LIBER](#), [AOSSG](#)/Università di Vienna).

Obiettivi

IOSSG nasce nel 2016 con lo scopo di promuovere in Italia lo sviluppo e la diffusione dell'**Open Science**, con particolare riferimento alla **European Open Science Cloud (EOSC)**.

Fornisce supporto e strumenti per rispondere alle sfide che la scienza aperta pone al mondo della ricerca: **processi della ricerca**, **ciclo di vita dei dati**, loro **gestione**, questioni relative alla **governance**, con particolare attenzione ai **servizi e alle infrastrutture**. L'attività del gruppo ha come focus l'impatto a **livello locale** delle politiche EOSC.

SEE OWN

What's an AsPredicted?

It is a standardized pre-registration that requires only what's necessary to separate exploratory from confirmatory analyses. You will easily generate a pre-registration document that takes less effort to evaluate than it takes to evaluate the published study itself.

About

Terms of use

How does it work?

- One author briefly answers 9 questions.
- All participating authors receive an email asking for approval.
- If everyone approves, it is saved and stays private until an author acts to make it public, or it remains private forever. ([Why?](#))
- Authors may share anonymous .pdf with reviewers.
- If made public, a single-page .pdf is generated. That document can be used as a supplement. ([See sample](#))
- The .pdf contains a unique URL that allows for one-click verification. That URL can be included in the paper.
- The .pdf is automatically stored in the web-archive. ([See sample](#))
- There are no accounts, userids, or passwords.

What if things don't go "as predicted"

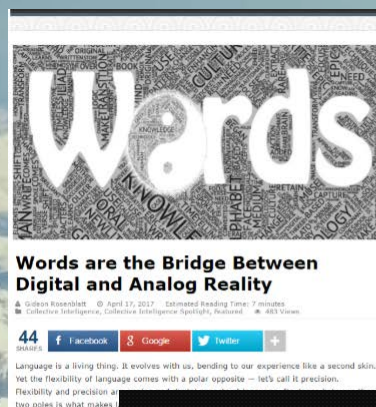

You can just say so in the paper:

- "Contrary to expectations, we found that..."
- "Unexpectedly, we also found that..."
- "In addition to the analyses we pre-registered we also ran..."
- "We encountered an unexpected situation, and followed our Standard Operating Procedure" ([.pdf](#))

Manage your research in one easy, integrated platform.

Collaborate, plan, create, preregister, even publish a preprint.

OSF provides free and open source project management support for researchers across the entire research lifecycle. As a collaboration tool, OSF helps researchers work on projects privately with a limited number of collaborators and make parts of their projects public, or make all the project publicly accessible for broader dissemination. As a workflow system, OSF enables connections to the many services researchers already use to streamline their process and increase efficiency. As a flexible repository, it can store and archive research data, protocols, and materials.

- **Structured projects:** Access files, data, code, and protocols in one centralized location and easily build custom organization for your project - No more trawling emails to find files or scrambling to recover from lost data
- **Controlled access:** Control which parts of a project are public or private, making it easy to collaborate and share with the community or just your team
- **Enhanced workflow:** Automate version control, get persistent identifiers for projects and materials, preregister your research, and connect your favorite third party services directly to OSF
- **Extensible Research.** Automatically create a preprint, meeting abstract, or add to your institutional repository. Manage multi-institutional projects.
- **Dependable Repository:** OSF's Preservation Fund ensures that any data stored in the repository would be maintained and protected for 50 years.

Re

THE PRO INITIATIVE
for open science

We believe that openness and transparency are core values of science. For a long time, technological obstacles prevented transparency from being the norm. With the advent of the internet, however, these obstacles have largely disappeared. The promise of open research can finally be realized, but this will require a cultural change in science. The power to create that change lies in the peer-review process.

Suggest that, beginning January 1, 2017, reviewers make open practices a pre-condition for more comprehensive review. This is only in reviewers' power: to drive the change, all that is needed is for reviewers to collectively agree that the time for change has

Open access

Da Wikipedia, l'enciclopedia libera.

(EN)

« Open Access literature is digital, online, free of charge, and mostly free of copyright and licensing restrictions »

(Peter Suber, *Open access overview: Focusing on open access to peer reviewed research articles and their preprints*, 2004.)

L'**open access** (in italiano, **accesso aperto**) è una modalità di pubblicazione del materiale prodotto dalla *ricerca*, come ad esempio gli *articoli scientifici* pubblicati in *riviste accademiche* o atti di conferenze, ma anche capitoli di libri, monografie, o dati sperimentali; che ne consente accesso libero e senza restrizione^[1]. Data la contrapposizione del modello di pubblicazione ad accesso aperto rispetto a quello classico, nel quale tipicamente le *case editrici accademiche* detengono *diritti esclusivi* sul materiale e ne vendono *abbonamenti* e licenze, l'espressione indica anche il movimento che sostiene e promuove la strategia ad accesso aperto. In un'accezione ancor più ampia, il termine esprime la libera disponibilità online di contenuti digitali in generale e riguarda l'insieme della conoscenza e della creatività

alla *proprietà intellettuale*.

(IT)

« La letteratura Open Access è digitale, online, gratis, e per la maggior parte libera da copyright e restrizioni legali »

Altmetric for Researchers

Track and demonstrate the reach and influence of your work to key stakeholders

[Introduction](#) [Using altmetrics](#) [Tools](#) [Case studies](#) [Get in touch](#)

Who's saying what about your published work?

Knowing who's talking about your research and what they're saying is crucial in today's increasingly online world. Ensuring your work is being accurately represented and interpreted, as well as getting to the right people at the right time, all plays an important factor in its broader impact.

The screenshot shows a web browser displaying a Figshare article. The page has a white header with the Figshare logo on the left, a search bar in the center, and 'Browse' and 'Upload' links on the right. On the far right of the header are 'Sign up' and 'Log in' buttons. The main content area features a large, light blue rounded rectangle with the text 'extensively searching for existing data before generating your own' in black. Below this rectangle, there are icons for download, search, and information. At the bottom of the page, there is a navigation bar with buttons for 'Cite', 'Download all (18.3 MB)', 'Share', 'Embed', and '+ Collect (you need to log in first)'. On the right side of the navigation bar, it shows '23 / 171' and some window control icons. The MD5 hash 'MD5: 3790cc54975eedc4429466535' is visible in the bottom right corner of the article content area.

Abstract

Open innovation is now a widely used concept in academia, business, and policy making. This article describes the state of open innovation at the intersection of research, practice, and policy. It discusses some key trends (e.g., digital transformation), challenges (e.g., uncertainty), and potential solutions (e.g., EU funding programs) in the context of open innovation and innovation policy. With this background, the authors introduce select papers published in this Special Section of *California Management Review* that were originally presented at the second annual World Open Innovation Conference, held in Santa Clara, California, in December of 2015.

Citizen science

https://it.wikipedia.org/wiki/Citizen_science

Da Wikipedia, l'enciclopedia libera.

Il termine ***citizen science*** (letteralmente, *scienza dei cittadini* in [inglese](#)) indica quel complesso di attività collegati ad una [ricerca scientifica](#) a cui partecipano semplici cittadini.

Tipologie di attività [[modifica](#) | [modifica wikitesto](#)]

Poiché la Citizen science si pratica in numerosi campi e in svariate discipline scientifiche sono stati proposti differenti ambiti di intervento e attività.

Una classificazione in termini di impegno da parte dei partecipanti è stata proposta da Muki Hacklay in Citizen Science and Policy: A European Perspective^[18] che riconosce i seguenti tipi di attività:

- Rilevazioni passive (Passive sensing): si basa sul fatto che i partecipanti mettono a disposizione una risorsa (ad esempio il proprio cellulare o uno spazio del proprio cortile) per effettuare delle rilevazioni in automatico mediante sensori appositi. Le informazioni ottenute vengono quindi inviate agli scienziati per una loro analisi e utilizzo. Un tipico esempio è [Flightradar24](#) in cui le informazioni sui voli attivi in una determinata area vengono forniti da volontari che hanno installato presso le loro case dei ricevitori ADS-B che ricevono segnali inviati dai trasponder dei velivoli.
- Volunteer Thinking : in cui i partecipanti contribuiscono al progetto utilizzando le proprie abilità nel riconoscere forme o analizzare informazioni, Generalmente in questo tipo di progetto i compiti sono abbastanza standardizzati in modo che i risultati rivenienti da diversi partecipanti possano essere facilmente comparati, Un tipico esempio di questo tipo di progetti è rappresentato da [Galaxy Zoo](#) nel quale centinaia di migliaia di partecipanti hanno classificato galassie con i loro computer aiutando gli astronomi nelle loro ricerche.
- Osservazioni ambientali ed ecologiche: progetti focalizzati sul monitoraggio ambientale o su osservazioni riguardanti la flora e la fauna. Un esempio è rappresentato dal progetto britannico Big Garden Birdwatch per l'osservazione e l'identificazione di uccelli con lo scopo finale di far acquisire una consapevolezza sugli aspetti di conservazione della natura e dei vari tipi di uccelli. Nel 2017 è stato lanciato un progetto europeo gruppo di ricercatori dell'[Università di Berna](#) per la mappatura della farfalla [Vanessa atalanta](#) che è nota per la sua migrazione nel continente europeo, i cui avvistamenti da parte di appassionati entomologi potranno essere comunicati tramite un sistema di portali web e applicazioni sviluppate per i dispositivi mobili^[19].
- Rilevazioni partecipate (Participatory sensing): è una tipologia simile alla precedente ma i partecipanti hanno un maggiore controllo sui processi. Un esempio è il progetto EveryAware in cui i partecipanti hanno usato i loro smartphone per monitorare il livello di rumore nei pressi dell'aeroporto Heathrow di Londra mediante un software fornito dagli organizzatori del progetto.
- Scienza civica e di comunità (Civic/Community science): in cui il progetto è iniziato e guidato da gruppi di partecipanti che identificano un problema che li riguarda. Un esempio è il progetto SafeCast emerso a seguito del terremoto di Fukushima per sviluppare un rilevatore fai-da-te (DIY) di radiazioni che i cittadini potessero usare nella loro vita quotidiana. La proposta è culminata nell'implementazione di un rilevatore a basso costo con il quale vengono forniti dati al sito di riferimento del progetto.
